Future Changes and Implementations

- Step 1 Body Figures
    - Change diagram to be more gender neutral (remove muscles, jaw line, hair line)
- Step 1 Part 4
    - Merge section A and B ("pain medication section" with "other pain medication")
- Treatment Detail Links
    - List of links that need to be updated and provide French versions available in the other doc
- Summary Page
    - Downloading pages of treatments from step 3 of the summary should include the smiley faces out of 100 for each treatment
    - add labels with the scales of the buttons (so we know what "0" represents and what "5" represents)
- Implement Summary page of the User Dashboard
    - Allows users to download pdfs of past summaries from their sessions using the JIA Option Map
- Add translation button to Admin Panel and User Dashboard, and get translations for both
- Step 1 Part 5
    - Have the buttons in part 5 to look like the other buttons in the web application or have all other buttons to look like the buttons in part 5

Bugs to fix

- Images for treatments in Step 3 not displaying, possibly due to an error when pathing to the upload folder
- Admin Panel can no longer update certain tables because they expect both an English and French column. Update Admin Panel to allow adding English and French text of what needs to be added

---

Enhancement

- Performance: content loading speed (maybe use Redux if the time is available)
- Implement UUID in the database rather than incremental ID
- Handle any memory leaks caused by async requests

- French version of app logo and name
- Separate App.css into separate files. Too long a file that contains the css of just about everything in the program, leads to confusion in program with similar named classes, and is also terrible coding etiquette
